Learn: pick up the keyboard shortcuts as you work

Learn is an optional helper that teaches you the shortcut of every button you click. **It is off until you turn it on**, so nothing changes unless you want it.

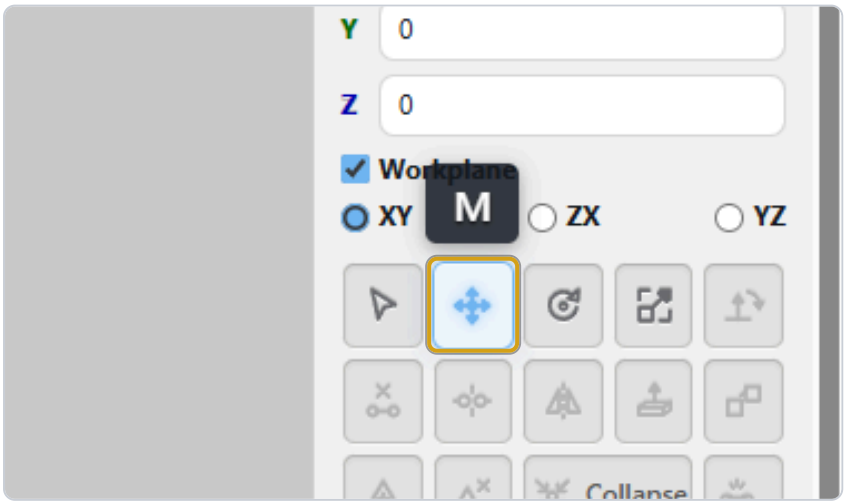

LER opens the Learn menu. With Show hotkeys on, every control shows its key in small green letters.

Turn it on

1. Click **LER** (the Ancient of Lore icon in the module dock, beside KEY).
2. Tick **Learn mode**. The LER icon glows while it is on.
3. **Ctrl+J** switches Learn mode on and off from anywhere.

What it does

- Click a button that has a shortcut and a small keycap pops up above it with its key, for example **M** for Move.
- After you use a key yourself **5 times**, its reminder stays quiet for **24 hours**. Each command is learned on its own.
- Click a popup to close it. **Right-click** a popup to mute that shortcut for good (bring it back in Keyboard Shortcuts).
- **Show hotkeys** (in the same menu) keeps the green letters on every button and dialog all the time. It is off by default too.

With Learn mode on, clicking a tool shows its key.

Learn settings and Alt shortcuts

Learn settings... opens Settings > Keyboard Shortcuts at the Learn block. There you choose where the popup appears, its size and look, how long it stays, after how many uses a key counts as learned and how long it then stays quiet. **Bring back learned keys** and **Bring back silenced keys** start over.

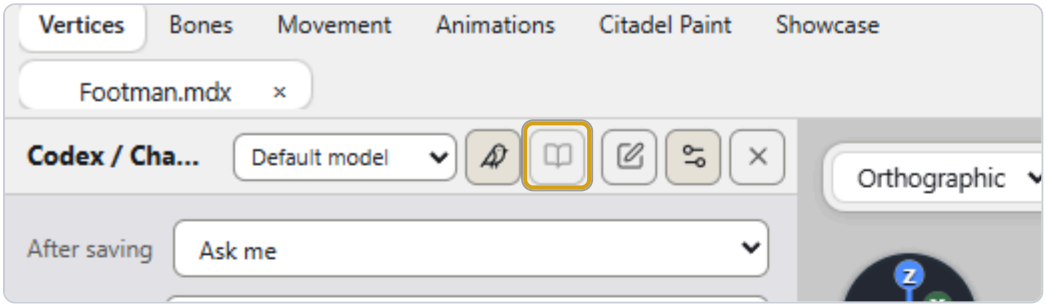

Alt, then a key

- Hold **Alt** to see the shortcut letters of the window you are in.
- Or **tap Alt** and let go: the letters stay up and the next key runs that Alt shortcut. Alt, then R opens Recovery. Esc or a click puts the letters away.
- Alt with a mouse drag still rotates the camera, as before.

> Learn is hidden in VIS (the classic MDLVis look). Ctrl+J and the Settings menu still work there.

AI Editing handbook: the AI's Warcraft III know-how

The **Editing handbook** is a switch in the AI console header (the book icon, next to the bird). It is **off by default**.

The book icon is the Editing handbook switch. The bird next to it is Offload Mode.

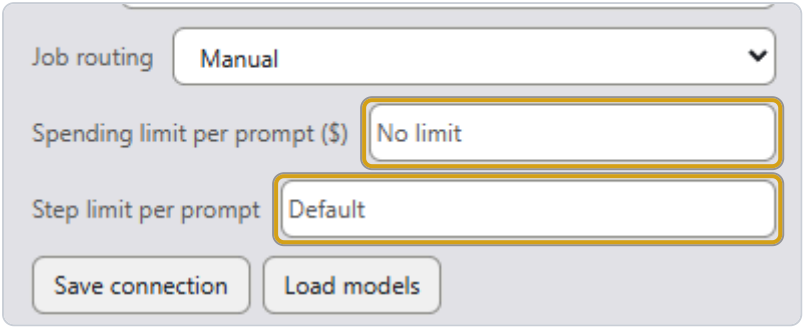

- When it is on, every request also carries a short set of general Warcraft III editing rules: how geosets, UVs, bones and pivots, animation keys, emitters and materials fit together, and what to check before calling a job done.
- The AI can also open seven step-by-step guides when it needs one: geometry, UVs and materials, nodes and binding, animation, emitters, getting the model into the game, and verification.
- It works with less trial and error on bigger edits: joining parts, re-binding vertices to bones, retiming animations, adding effects or repairing normals.
- A job keeps the setting it started with; a change applies from your next request. Workers in Offload Mode get the same rules.
- Turn it off for small, simple jobs: the rules are extra text sent with every request.

Its shortcut letter is **W**.

Save credits with the AI

The AI now shows what it costs and lets you cap it. A few habits save the most:

Connection settings for the Anthropic API: Spending limit per prompt ($) and Step limit per prompt.

Limits and cost

- Under every API reply a small grey line shows what the prompt cost so far, in US$ for current Claude models or in tokens for others.
- **Spending limit per prompt ($)**: the prompt stops when it reaches this amount. Edits already made stay, and you can carry on. Empty means no limit.
- **Step limit per prompt**: the most steps (tool rounds) one prompt may take. Empty keeps the normal maximum of 64.
- Claude API requests are now cached automatically, so the long instructions and earlier steps are not paid at full price again on every step.
- A chat stays on the connection it started on. Switching from your Claude plan to an API key starts a new chat, so nothing moves to the paid key by surprise.

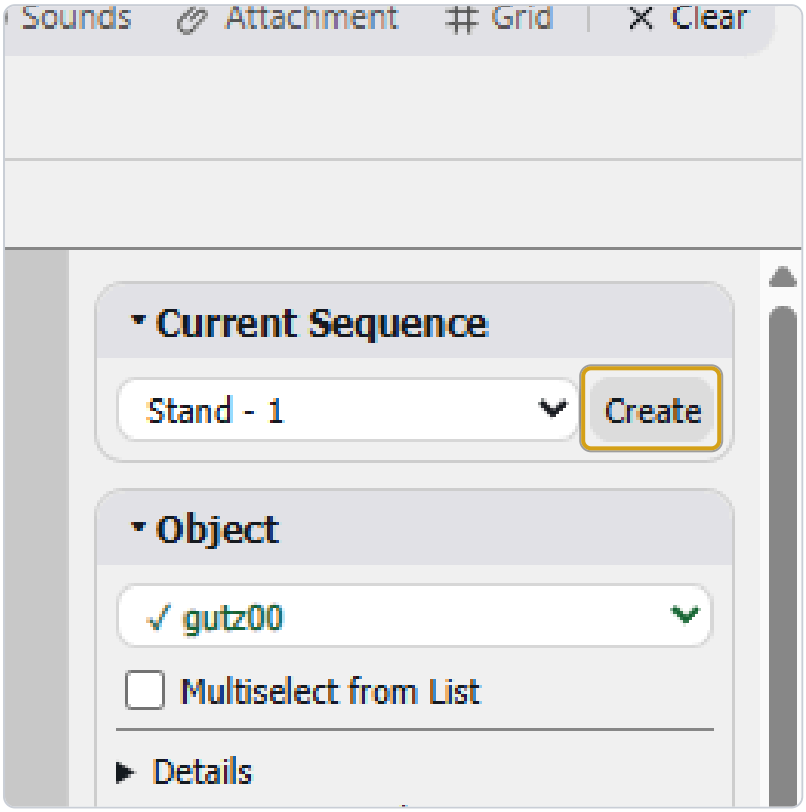

Habits that save the most

- Use your plan: the **Claude** (Claude Code) or **Codex** connection runs on your subscription instead of a pay-per-use API key.
- Select the vertices or bones first and draw on the view with Marker or Pen. The AI then knows where to work and spends fewer steps looking.
- One job per message. Start a **New chat** for unrelated work: a short chat is cheaper than a long one.
- In Offload Mode, **Allow lighter models for simple jobs** (Connection settings, off by default) lets clear, exact jobs use a cheaper model. Unclear or spatial jobs still ask first.
- Leave the Editing handbook and SD Brain off unless the job needs them.
- Press **Stop** (the square) as soon as it goes the wrong way. Everything already done stays in Undo.

Other new features

Create in Movement

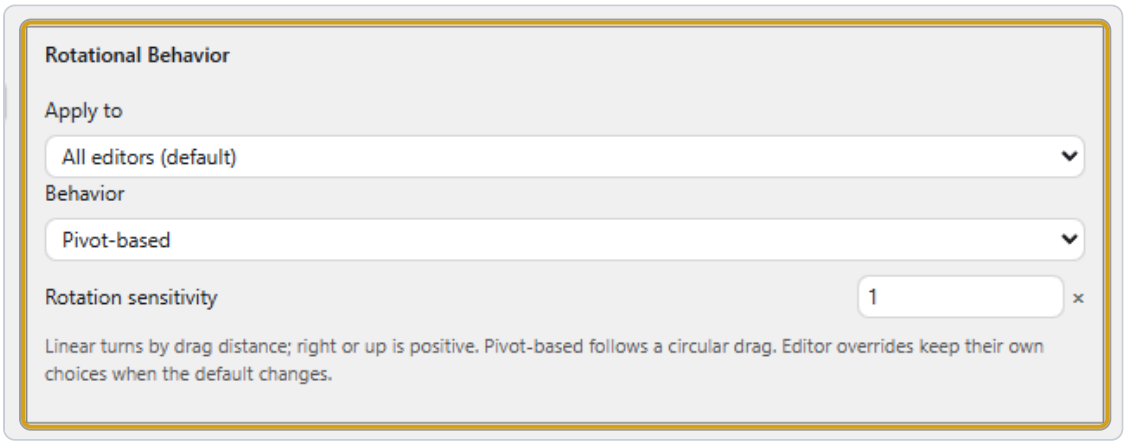

Movement has a **Create** button next to its animation list. It makes a new one-second animation, exactly like Create in Animations.

Create in Movement.

Rotation: Pivot-based or Linear

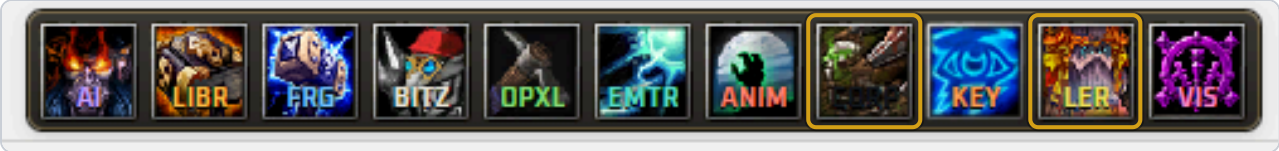

Settings > Mouse > Rotation sets how a Rotate drag turns: **Pivot-based** (circle the mouse around the centre, the default) or **Linear** (drag right or up to turn steadily). Set it for every editor or just one.

Other new features (continued)

Auto Corpse (test)

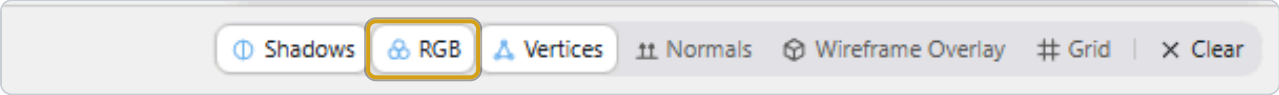

The **CORP** button fits a corpse to the last frame of the Death animation, creates Decay Flesh and Decay Bone and sets visibility, all in one click. One Undo puts the model back.

The module dock: CORP and LER.

RGB in the display checkboxes

In Vertices, the **RGB** checkbox shows the model's colours and fades from its Stand animation.

And also

- **Space** always plays or stops the animation, even right after clicking a checkbox or button.
- EMTR opens on the effects the model already has when nothing is selected.
- New effects and Forge's HD maps use Warcraft III's own textures.
- Showcase backgrounds stay in Showcase; Animations and Movement show the normal view.
- VIS is the classic MDLVis layout again, with a small **XL** button to switch back.
- Recovery keeps one draft per model and the 15 newest.
