MDLxL 0.29.0

Quick manual | New in 0.29.0

Actual editor screens (English interface shown).

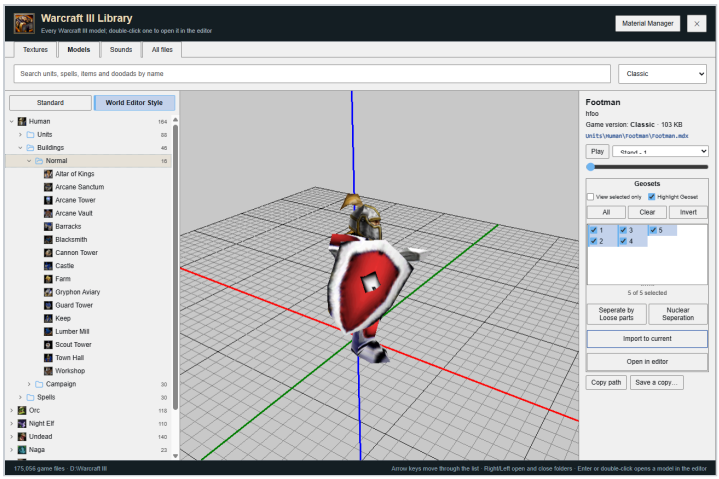

Attachemator: attachment points in one click

1. Open **Bones** mode. Under **Tools**, click **Attachemator**.
2. A preview opens with every standard point: Origin, OverHead, Head, Chest, hands, feet and Weapon, on the bones Blizzard uses for them. Mounts also get rear feet.
3. Click a point to see its bone. Drag it with the normal **Move** handle, choose another bone, or use **Pick** and click a bone in the preview.
4. Untick a point to keep it exactly as it is. Drag empty space to turn the camera.
5. Click **Commit**. It is one Undo step.

> Existing points are recognised by name, moved and re-parented. Points that are already right are left alone.

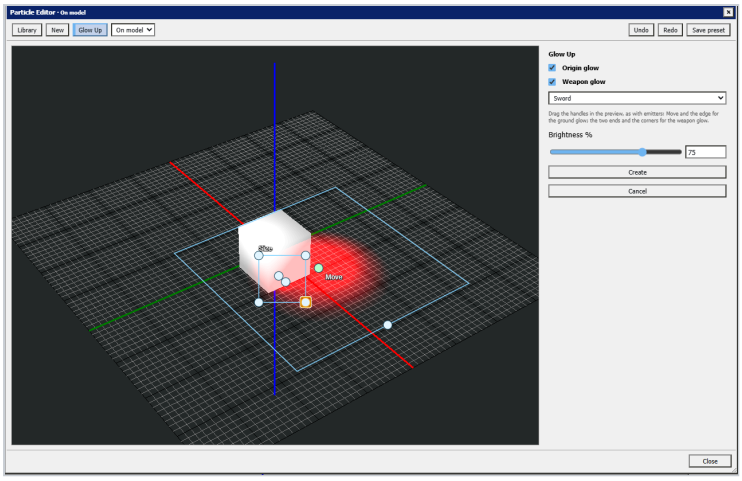

Warcraft III Library

1. Click **LIBR** on the toolbar. Choose **Textures**, **Models**, **Sounds** or **All files**.
2. Models: **World Editor Style** sorts by race, units, heroes, buildings, spells, items and doodads, with game icons. **Standard** shows the game folders.
3. Type in the search box; about 175,000 files are searched instantly. Try `painting`, `art` or `loading screen` for the game's illustrations.
4. Drag the preview to turn the model and pick an animation. Double-click or **Open in editor** opens it as a new tab.
5. Under **Geosets**, tick parts of the model and click **Import to current** to copy them into your model. Sounds play on click; **Save a copy…** copies any file out of the game.

> If a texture is already in your model, adding it asks: **Use existing material** or **Make a new material**. The texture pickers in UV Wrapper, Material Manager, EMTR, Forge and Citadel Paint are unchanged.

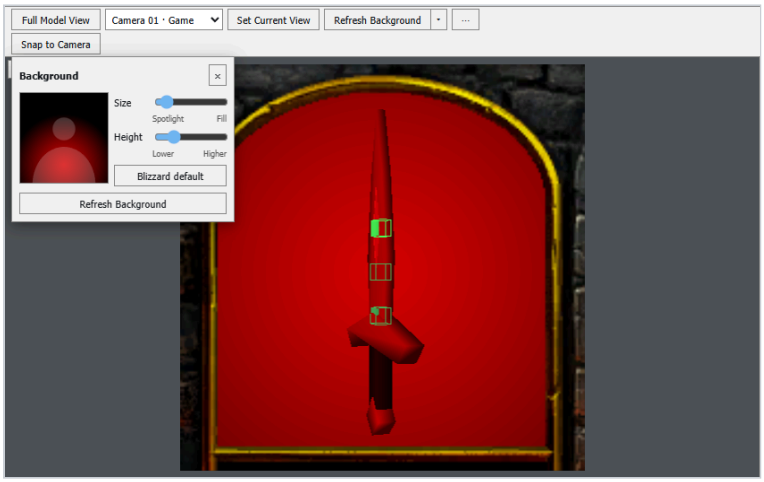

Glow Up: hero glow in EMTR

1. Open **EMTR** and click **Glow Up** in its top bar.
2. Tick **Origin glow** for the pulsing team-glow at the feet, and **Weapon glow** for glow along a weapon. Pick the weapon from the list.
3. Size and place the glows by dragging their handles in the preview, as with emitters: Move and the edge for the ground glow, the two ends and corners for the weapon glow. Set **Brightness %**. Drag empty space to turn the camera.
4. Click **Create**. It is one Undo step.

> The glow is built like Blizzard's heroes: three pulsing team-glow planes at the feet, a row of camera-facing glow squares on the weapon, hidden in Death and Decay.

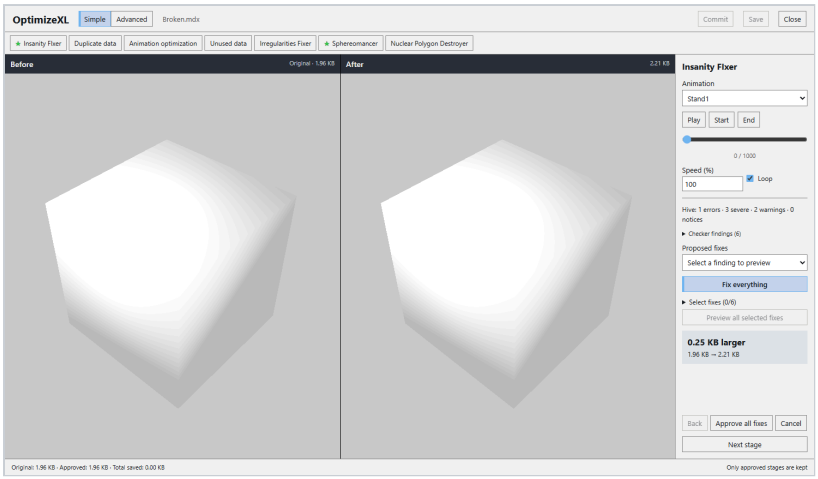

Portrait background

1. In **Movement** or **Animations**, choose a Portrait animation and the portrait camera.
2. Click **Add Background**. A Warcraft-style team-color backdrop is placed behind the model for that camera, the way Blizzard's portraits do it.
3. Click ▾ for **Size** (Spotlight to Fill), **Height** and **Blizzard default**, with a small preview of the game crop.
4. After changing the camera, click **Refresh Background** to place it again.

> The backdrop is only visible in Portrait animations. Add and Refresh are one Undo step each.

OptimizeXL: Fix everything

1. Open **OptimizeXL**. The checker's findings are listed first.
2. Click **Fix everything**. All repairs are previewed at once; Before and After sit side by side.
3. Problems that need a decision show a **Choice** with a default. Click **Approve all fixes** to keep them.
4. Click **Save**: the result goes into your open model as one Undo step. The first save offers **Back up, then save**.

What else changed

- **Forge**: copy or mirror an extrusion or bevel and place it with Move, Rotate and Workplane; the **Magnet** handle keeps it on the surface. Hold **Shift** to snap cuts. **Blend** extrudes adjoining flat faces as one.
- **Perspective** zoom moves the camera back instead of widening the lens.
- **Sound events** list every game sound by use, with ROC / TFT / RE / FK filters.
- **Appearance** → **Bones & skeleton**: separate Bone style and Skeleton style.
- UV mapper: the numpad moves selected UVs in eight directions. Emitters on camera-facing bones stay put while you edit.

Update or download

1. Open **Settings > Configuration**. Click **Search for updates**, then **Update and restart**.
2. Save when asked and let MDLxL restart. Do not reopen it during installation.
3. If updating fails, use the full download. Extract the whole ZIP into a new folder and run **MDLxL.exe**.
