New in MDLxL 0.35.0 Pivots in sight

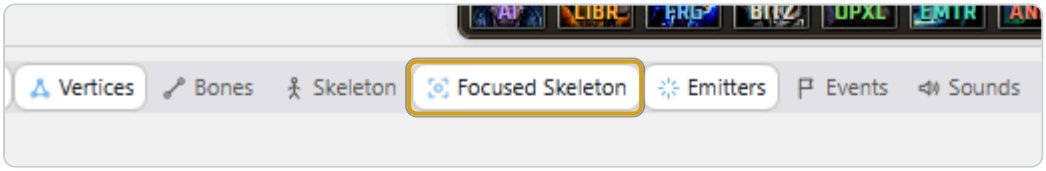

Double-click a part to see its bones

In **Movement**, **Bones** or **Animations**, double-click any part of the model in the preview. The bones that part hangs on are selected and **Focused Skeleton** turns on, even if Bones and Focused Skeleton were off.

After a double-click on the model: the chosen bone and its neighbours, each with its pivot cross.

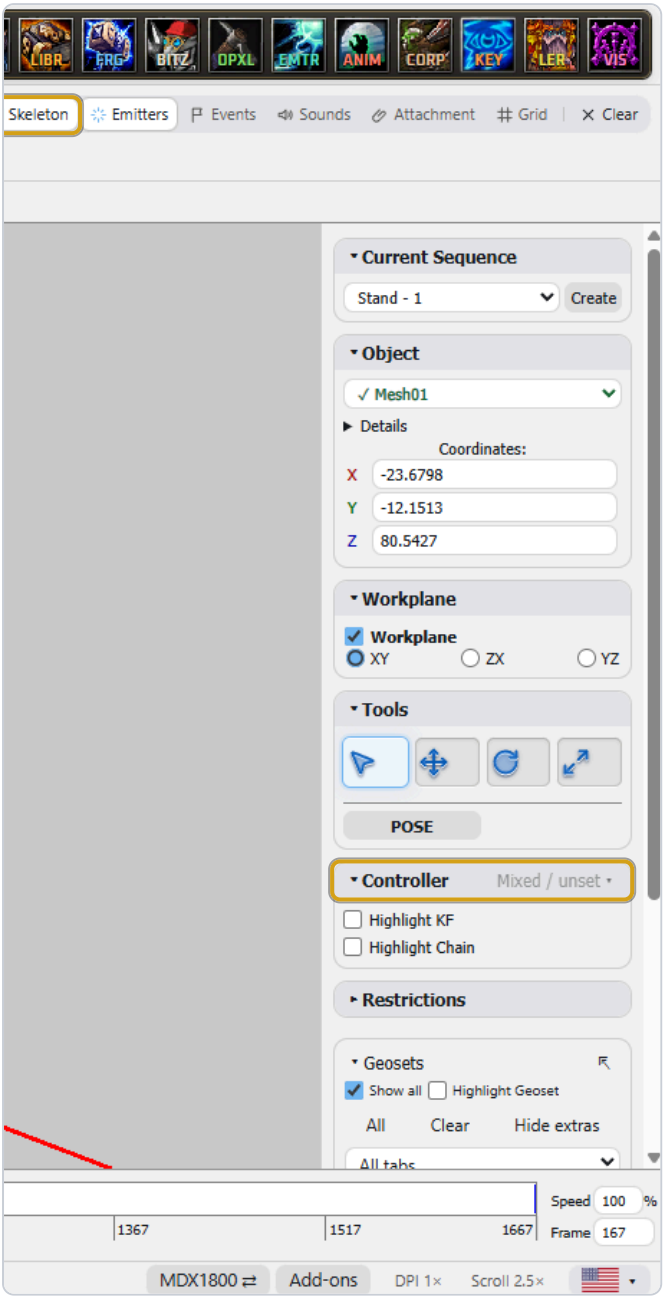

Every bone Focused Skeleton highlights shows a **pivot cross**: its own X (red), Y (green) and Z (blue) axes through its pivot. The cross turns with the bone, so during playback you can see exactly how it rotates.

Focused Skeleton is the switch at the top right; the double-click turns it on for you.

Controller type in the heading, multiselect always on

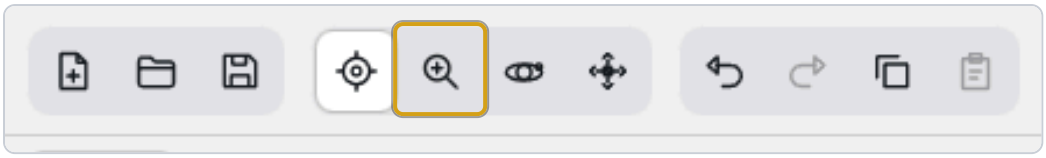

The Movement sidebar: Controller type is the small dropdown in the Controller heading.

Controller type is now a small dropdown inside the **Controller** heading. Clicking the dropdown does not fold the section; clicking the word Controller still does.

The **Multiselect from List** switch is gone, because multiselect is always on:

- **Shift**-click adds an object, **Ctrl**-click removes one;
- a plain click selects just that object;
- this works the same in the preview and in the **Object** list.

Zoom Align

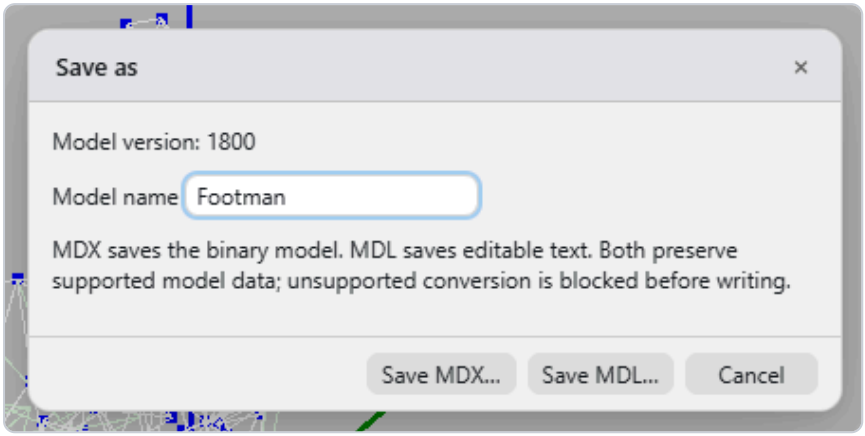

The Zoom tool in the top toolbar.

1. Select the vertices you want to line up.
2. Choose the **Zoom** tool and press **Shift+1**.
3. Drag a small box around one selected vertex: it turns **pink** and shows ALIGN.
4. Zoom in: the other points slide until each one sits right behind the pink vertex, as seen from your view. Each keeps its distance from the eye, so a crooked surface becomes flat from that view.

> It stops when everything is lined up. **Anchor** (**1**, green) and **Align** (**Shift+1**, pink) work one at a time: picking one replaces the other. One Undo reverts the whole drag.

Save as: Model name

File > Save as... now has a Model name field.

The **Save as** window has a **Model name** field: the name stored inside the model, separate from the file name. Change it before saving MDX or MDL.

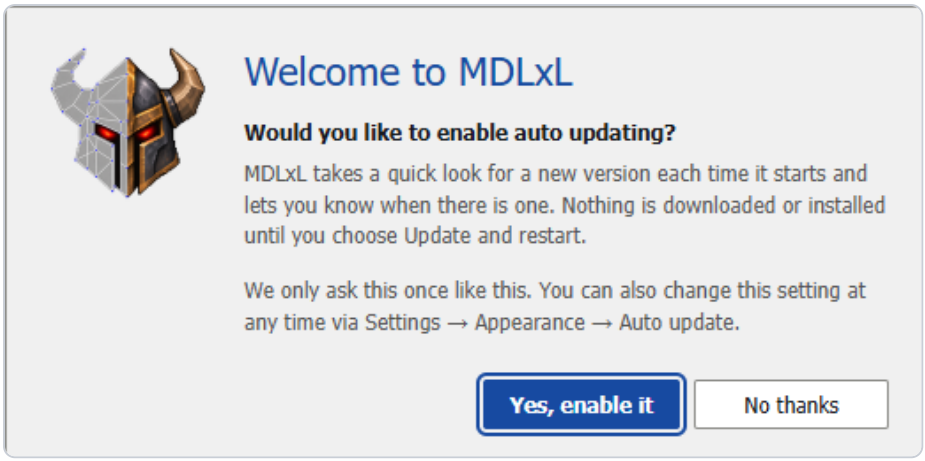

Glow Up: Play and Pause

Particle Editor (EMTR) with Glow Up open: the Play / Pause button under the preview.

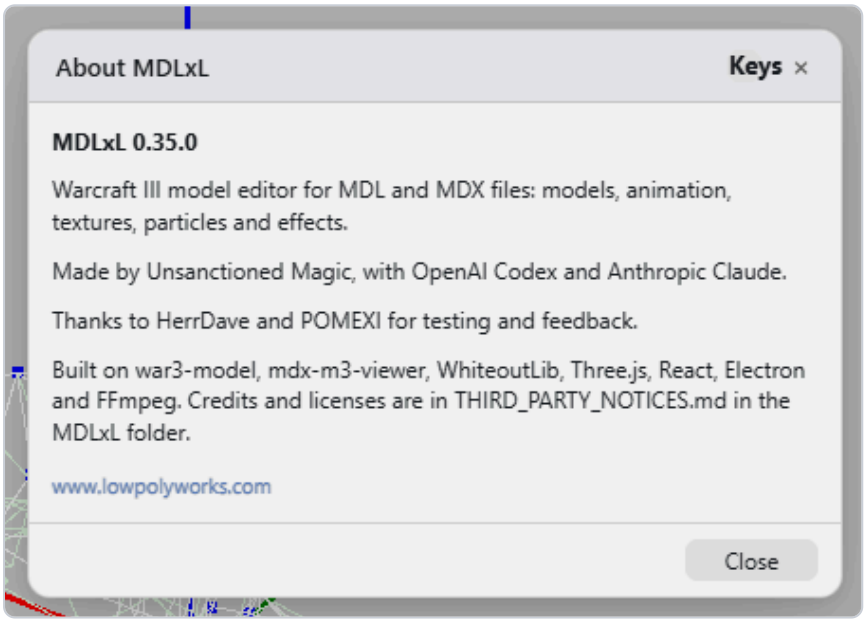

Glow Up now shows EMTR's own **Play / Pause** button under the preview (**Space** does the same). Pause the animation, then place both ends of the weapon glow while the model holds still.

Welcome window and a real About

The first-launch welcome window.

The first time MDLxL starts, it greets you with a small welcome window and a short fanfare, asking whether to turn on **Auto update**. You can change this later in **Settings > Appearance > Auto update**.

Help > About.

Help > About shows the version, what MDLxL is, who made it and what it is built on. The empty **Check model** entry is gone from Help. Spanish, Russian and Chinese now cover the texts added over the last releases.
