The new MDLxL look at a glance

MDLxL 0.31.0

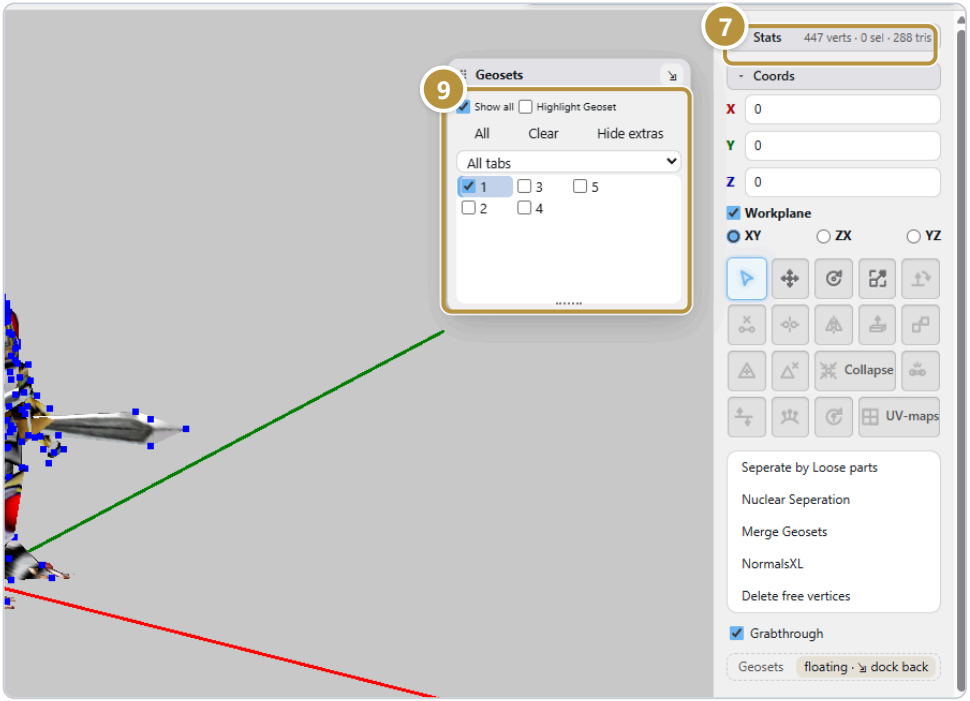

1. **File, camera and history**
   New, Open, Save; camera tools; Undo, Redo, Copy, Paste. Hide and Show sit right after.
2. **Display chips**
   Shadows, Vertices, Normals, Wireframe Overlay, Grid. A lit chip is on. On narrow windows only the icons stay; hover for the name.
3. **Team colour, format, Add-ons, language**
   Pick the team colour, switch MDX/MDL format, open Add-ons and change the language.
4. **Workspaces**
   Vertices, Bones, Movement, Animations, Citadel Paint and Showcase, with your open model tabs below.
5. **Module dock**
   Square Warcraft III icons for every module. The first one, Illidan's Metamorphosis, opens the AI console. The last one is VIS.
6. **View controls**
   Projection, display mode (Textured View, Wireframe…), Quad View, Fit and Fit selection.
7. **Stats and Coords**
   Click a header to fold it. Folded Stats still shows vertices · selected · triangles in one line.
8. **Carved tools**
   The editing tools. The active tool glows in your theme's accent colour.
9. **Geosets**
   ↖ floats the list over the view; drag it by its title bar. ↘ docks it back.
10. **Status bar**
    Messages and warnings, the current editor and the zoom readout.

Good to know

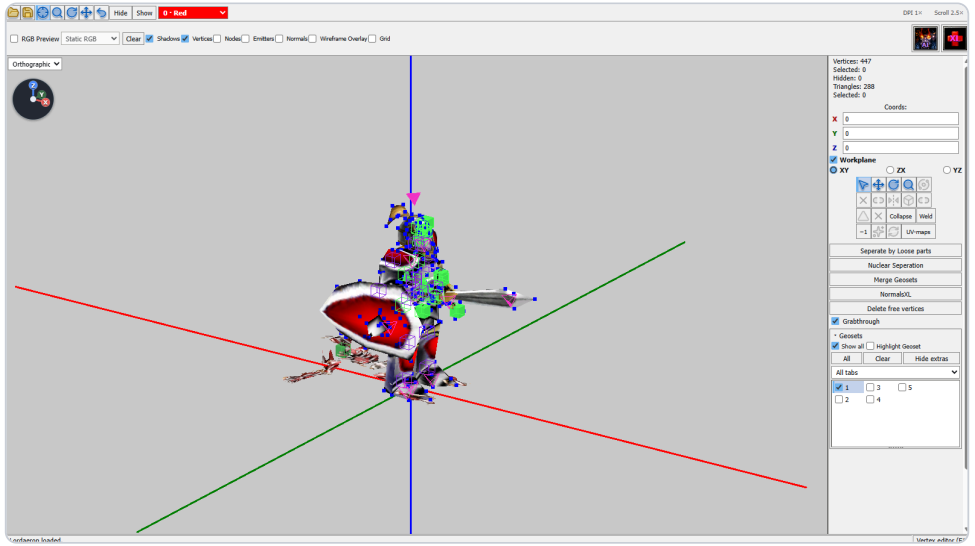

- Tool highlight colour: Settings > Appearance > Interface > Tool highlight. Use accent goes back to the theme colour.
- Shift+F1 switches to a dark look, Shift+F2 to a light one. Switching back restores your own look exactly.
- All seven themes get the new look. Every window and dialog uses the same rounded cards, buttons and tabs.

Interface map The new MDLxL look at a glance

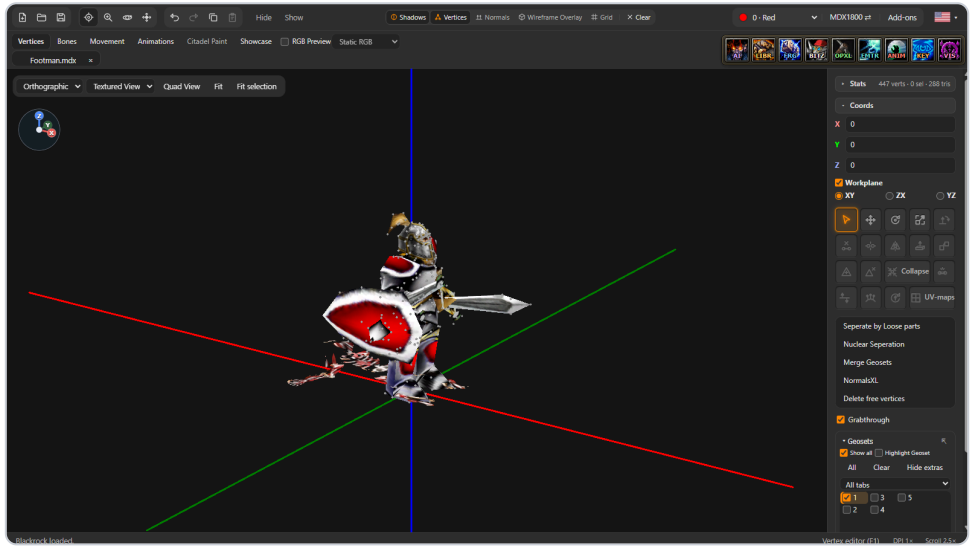

MDLxL 0.31.0

Stats folded and Geosets floating over the view.

VIS on: the classic, old-school MDLVis look, unchanged. The AI icon sits next to XL.

The same layout in a dark theme (Blackrock).
