AI console Let an AI edit your model and animations

1 Open the console

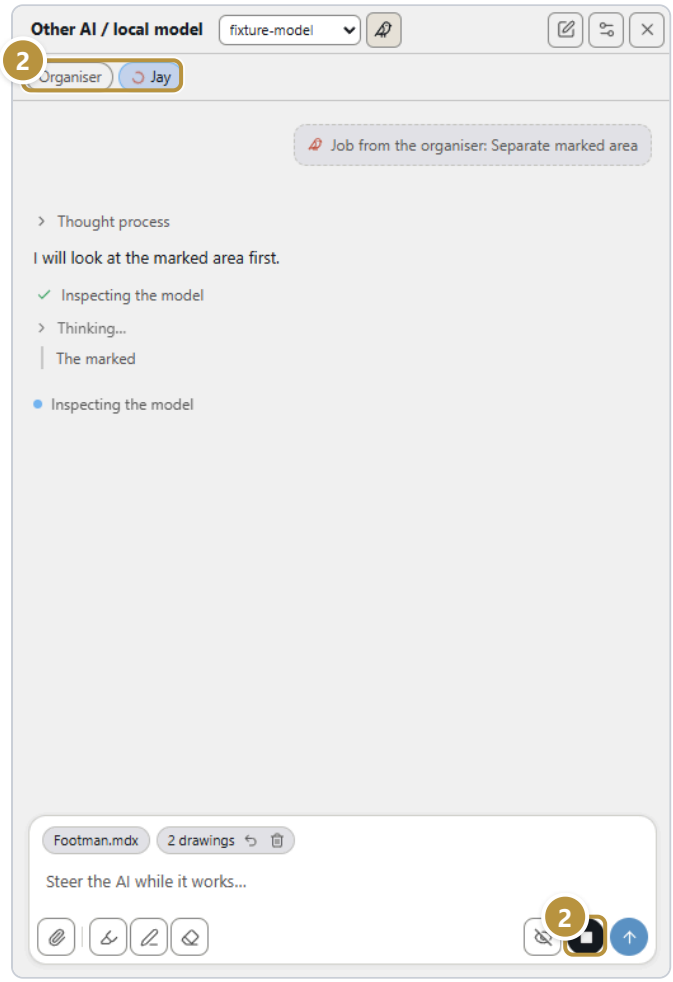

Click the AI icon, the first icon in the module dock (with VIS on it sits next to XL). The console docks on the left; drag its edge to make it wider and click ✕ to close it. First time? Connect your AI with the AI sign-in guide.

The AI icon is first in the module dock.

2 Ask, watch and steer

Type what you want and press Enter. While the AI works you see its Thinking and each step it takes; click a step to see the details. Keep typing to steer it mid-task; the square Stop button cancels. Edits it already made stay in Undo.

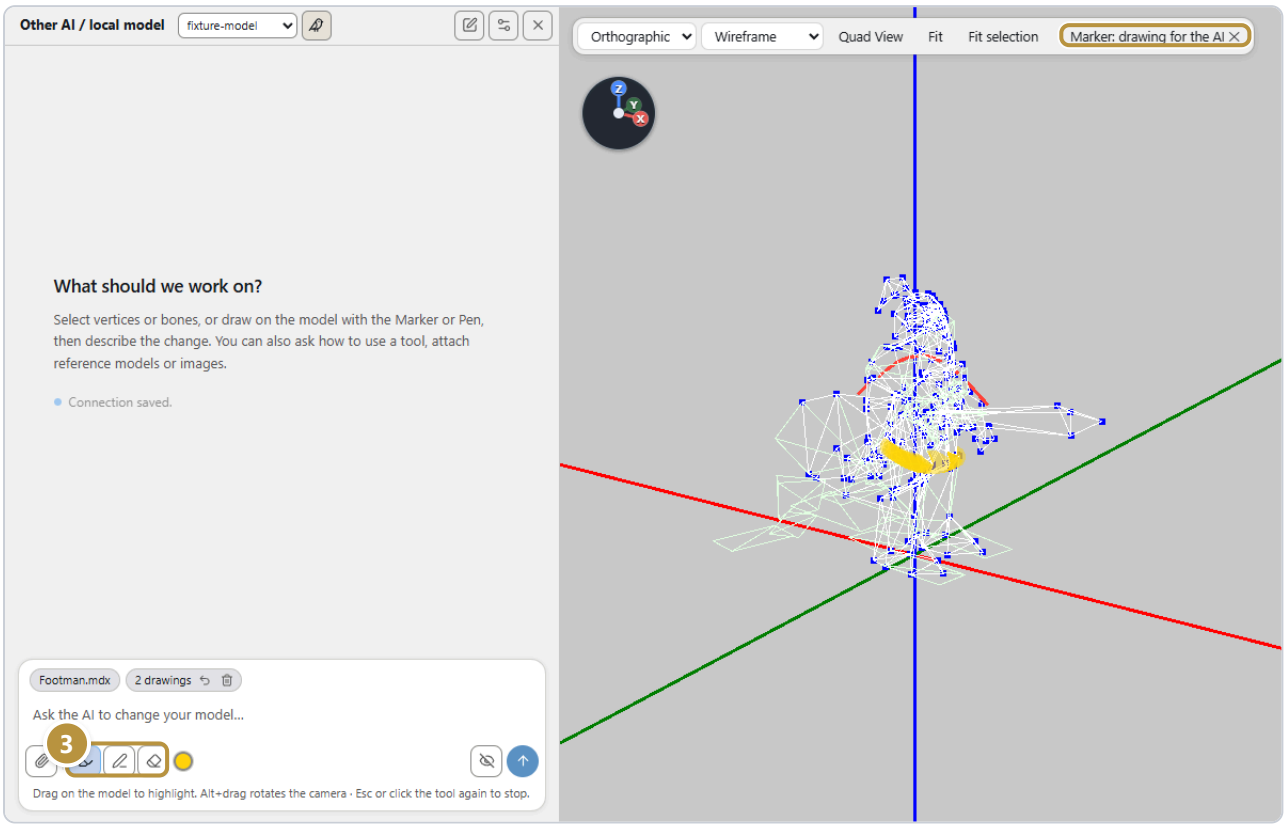

A worker bird thinking and taking steps.

3 Draw to show what you mean

Marker, Pen and Eraser sit in the message box. Drag on the model to mark an area; the AI sees your drawings with your message. Drawings never change the model or its file. Alt+drag still turns the camera; Esc or clicking the tool again stops drawing. With a drawing tool on, Ctrl+Z undoes drawings.

Marker strokes on the model; the bar shows “Marker: drawing for the AI ×”.

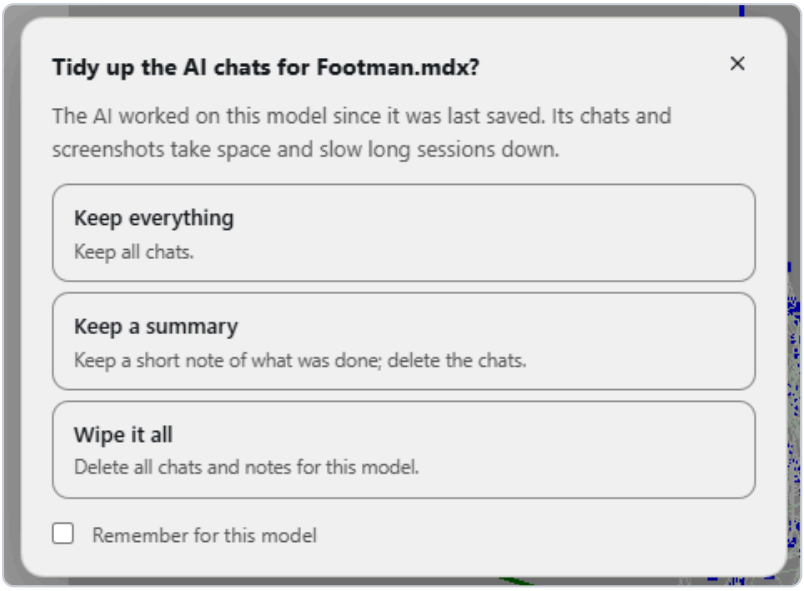

4 Offload Mode and the birds

Offload Mode is on by default (bird switch next to the model picker). An organiser hands each job to a worker with a bird name, which keeps long sessions fast. The chips above the chat show them; click a bird to read or talk to it. Each model tab runs its own AI job, and the AI keeps working while you use other tabs.

5 After saving

When you save a model the AI worked on, MDLxL asks: Keep everything, Keep a summary or Wipe it all. Tick Remember for this model to skip the question; After saving in Connection changes it later.

Tidying the AI chats after saving.

Your model stays safe

- Nothing is saved just because you sent a message.
- An AI edit that would leave the model unsavable is undone straight away and explained.
- Replacing an existing file always asks you first.
